Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is an immunomodulatory peptide, which comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                 1..10

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          impunomodulating activity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal andated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-771) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa79 = R or G; aa80 = 1 or N; aa81, aa84 = a hydrophobic or amil amino acid; aa82 = R or L; aa83 = G or R; and a represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HLA-B alphal domain (positions 79-84). They can be used to inhibit cytocoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatcoid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                 Immunomodulating dimer; immunosuppressant drug; CTL activation;
transplantation; autoimmune disease; Class I HLA-B alpha-1 domain;
rejection.
                                                                                                                                                                                                                                                                                   Peptide B2702.84-75T/75-84T tested for immunomodulating activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New immunomodulating dimer peptide(s) - based on a Class I HLA-B alpha-1 domain, used for preventing rejection of transplants or treating autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptides AAW33784-98 and AAW33778-9 were assayed for their

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is an immunomodulatory peptide, which comprises a Class I HLA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic doing of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of function, and selecting the second subset from physico-chemical parameters, determining their value parameters based on the values of function, such that each second subset is more closely associated with the activity than the first subset. The selected physico-chemical parameters are useful for developing criteria for screening candidate molecules and are suitable for use in silico screening of compounds. The compounds may be used in pharmaceuticals, cosmetics, agrochemicals, biomaterials and in veterinary applications. It is also useful as an antibiotic or antifungal agent. The present sequence is an immunosuppressive peptide, 2702.49-75 (also referred as D2702.75-84), identified by in silico screening. The immunosuppressive activity of the peptide that prevents allograft rejection is tested in a heterotopic allograft model of mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        activity. The method involves selecting the first subset f predetermined set of physico-chemical parameters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HLA; p74; alphal-helix; human-leucocyte-associated antigen; inhibitor; T-cell lysate; membrane protein; mammal; heat shock protein; Hsc70; AF B cell; calcium influx; cytotoxic T lymphocyte; CTL; differentiation;

AAR95413, and AAR95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequence can be used to isolate the protein p74 from a T-cell Jaste. P74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is a laso immunologically cross reactive with the heat shock protein Haso70. P74 is found in a limited number of cell types, but is particularly expressed on B and T cells. P74 can be isolated by lysis of a suitable column containing a covalently bound His-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with Compositions comprising the extracellular fragment of p74 combined compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the compound and p74. Modulation of CTL activity can be inhibited in a cellular constanting T-cells and antigen presenting cells (APCS), by adding the mix the central presenting cells (APCS), by adding the mix the central presenting cells (APCS), by Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702. Gaps adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand Extension of acceptance period of transplants from MHC unmatched donor hosts - using Class I B75-84 MHC antigen of the recipient . 0 Score 22; DB 16; Length 20; Pred.                                                                                                                                             AAR83061-R83085, AAR83090-R83096 and AAR92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     period of acceptance by a recipient of a transplant from an MHC unmatched donor.                                                                                                                                                                                                                                                                                   AAR83061-R83085, AAR83090-R83096 and AAR92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B7. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs)
                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B7.

                                                                                                                                                                                                                                                       AAR83061-R83085, AAR83090-R83096 and AAR92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unnatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
        Cytotoxic T lymphocyte, CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a specifically claimed immunomodulating cdimer peptide of the invention. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal control of the compound or variant is colling activity, including the N-terminal control of the compound activity. Including the N-terminal control of the compound activity, including the N-terminal control of the compound activity, including the N-terminal control of the compound activity, including the N-terminal control of the compound comprises the formula; A-B, control of the compound comprises the formula; A-B, control of the compound comprises and activity, aa91 aa81, aa84 activity, aa97 activity, aa97 activity aa80 activity aa81 activity aa84 activity activity aa81 activity aa84 activity  Activity activity activity activity activity activity act

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                            (without alignments)

  AAR95413, and AAR95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the HLA-B2702.75-84(T). These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70. p74 is found in a limited number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide.
               host
  determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCs), I adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.
   Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see AAR95416), induces calcium influx, and inhibits cytotoxic Tlymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and

      Peptides AAW33784-98 and AAW33778-9 were assayed for their immunomodulating activity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or C-terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = D, S or N; aa79 = R or G; aa80 = I or N; aa81, aa84= a hydrophobic or small amino acid; aa82 = R or L; aa83 = G or R; and aa represents amino acid. The sequence in the brackets may optionably be absent or truncated
  AAR83061-R83085, AAR83090-R83096 and AAR92907-R92913 represent fragments of class I major histocompatibility complex (MHC), antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. This sequence showed no inhibitory effect upon cytotoxic T lymphocytes (CTLs). These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched domor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the CTLs of the

  The present sequence is a peptide which may be used in a method for inhibiting activation of cytotoxic T lymphocytes and/or natural killer cells. The method involves combining the cells with a compound comprising an oligopeptide of at least 6 amino acids comprising a contiguous sequence of a human leukocyte antigen (HLA)-B alphal domain including amino acids 84-86 are YYW. The method is useful for transplanting a donor mammalian organ or cells to a mammalian recipient. The organ or cells are combined with the compound prior to implanting in the mammalian recipient, or the compound may be administered to the mammalian recipient in a period extending from prior to implanting the donor organ or cells.
                 (positions
amino acid sequences related to a Class I HLA-B alphal domain (position 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.
   Inhibiting activation of cytotoxic T lymphocytes and/or natural killer cells involves combining cells with compound comprising oligopeptide with contiguous sequence of human leukocyte antigen-B alphal domain -

  The present sequence is a peptide which may be used in a method for inhibiting activation of cytotoxic Tlymphocytes and/or natural killer cells. The method involves combining the cells with a compound comprising an oligopeptide of at least 6 amino acids comprising a contiguous sequence of a human leukocyte antigen (HLA)-B alphal domain including amino acids 84-86, where amino acids 84-86 are YYW. The method is useful for transplanting a donor mammalian organ or cells to a mammalian recipient. The organ or cells are combined with the compound prior to implanting in the mammalian recipient, or the compound prior to implanting in the mammalian recipient or the compound prior to implanting the donor organ or cells.

  of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B270.2. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.

  Nucleic acids encoding 26 human secreted polypeptides, useful e.g. for preventing, diagnosing and/or treating cancers and for promoting wound
  The present invention relates to 26 secreted human proteins. The proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. For example, they may be used in gene therapy or in vaccines. Typical of diseases which are potentially treatable are cancers (including leukemia), autoimmune diseases, allergies, inflammation, graft rejection, hyperproliferation, cardiovascular diseases (particularly critical limb ischemia and coronary disease) involving abnormal anglogenesis, neurodegeneration and/or

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                  GenCore version 5.1.3
